

Film Apps

Film Apps is a portfolio project developed to implement Flutter in mobile app development.

This application aims to display information about various films retrieved from The Movie Database (TMDB) through an API.

In its development, this project implemented Clean Architecture, BLoC for state management, and Dio for integration and communication with the API.

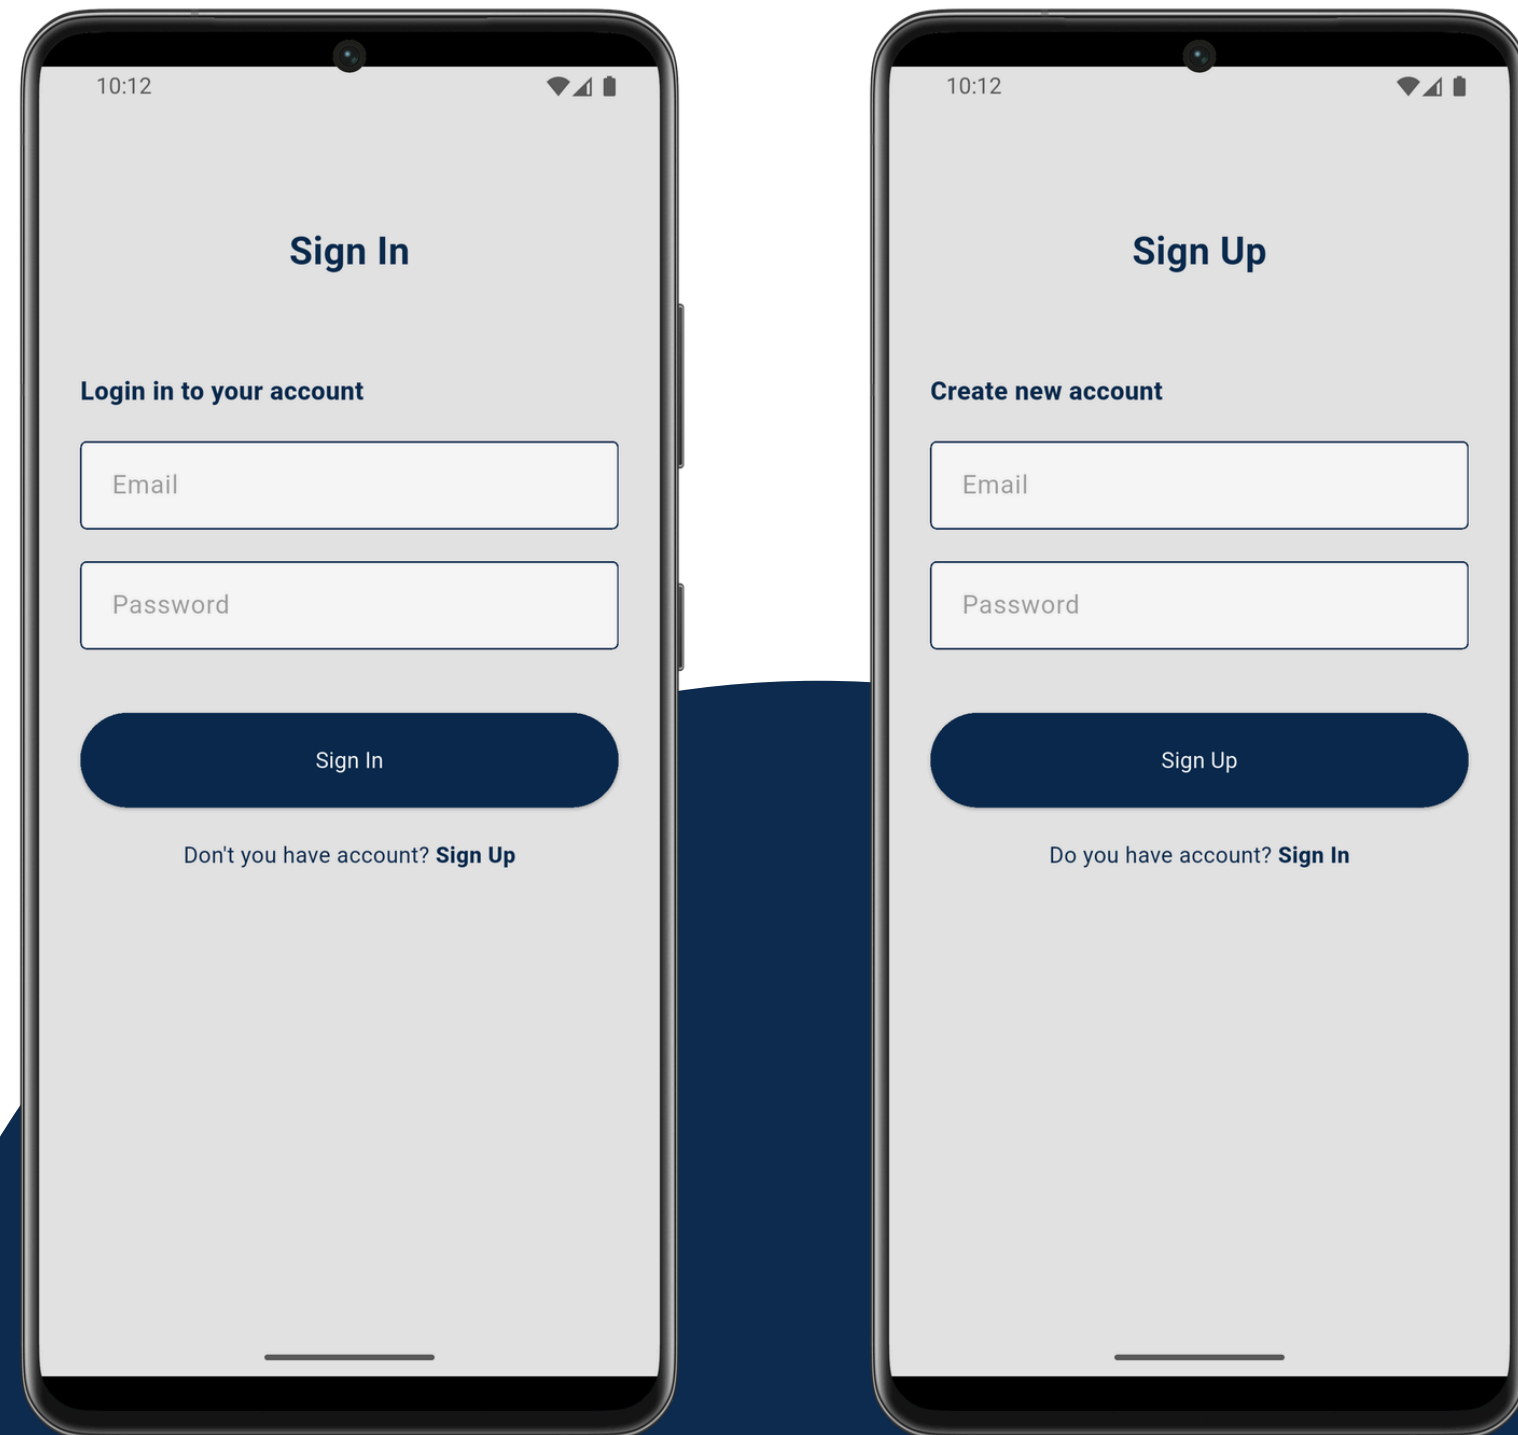

Overview Application

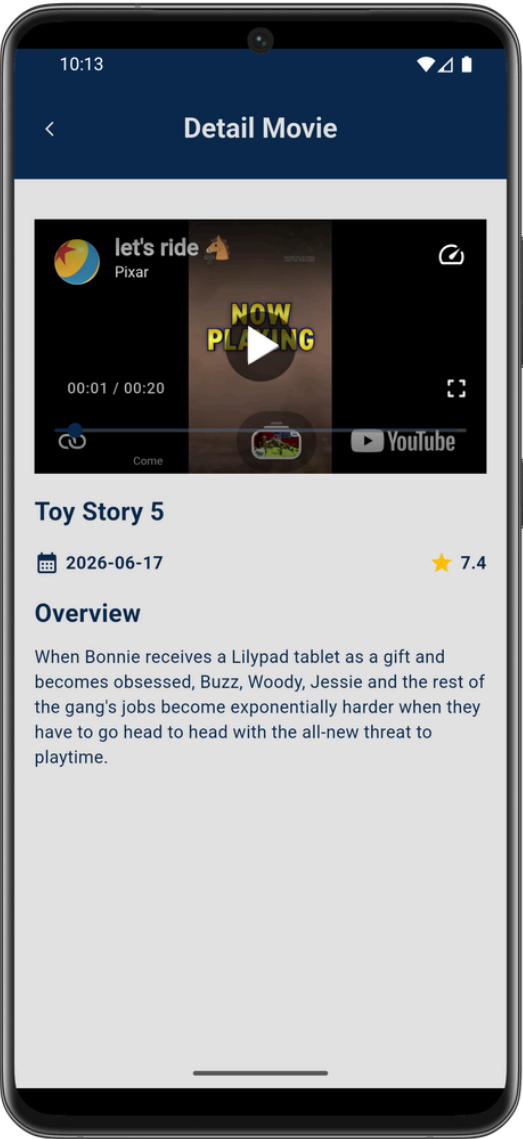

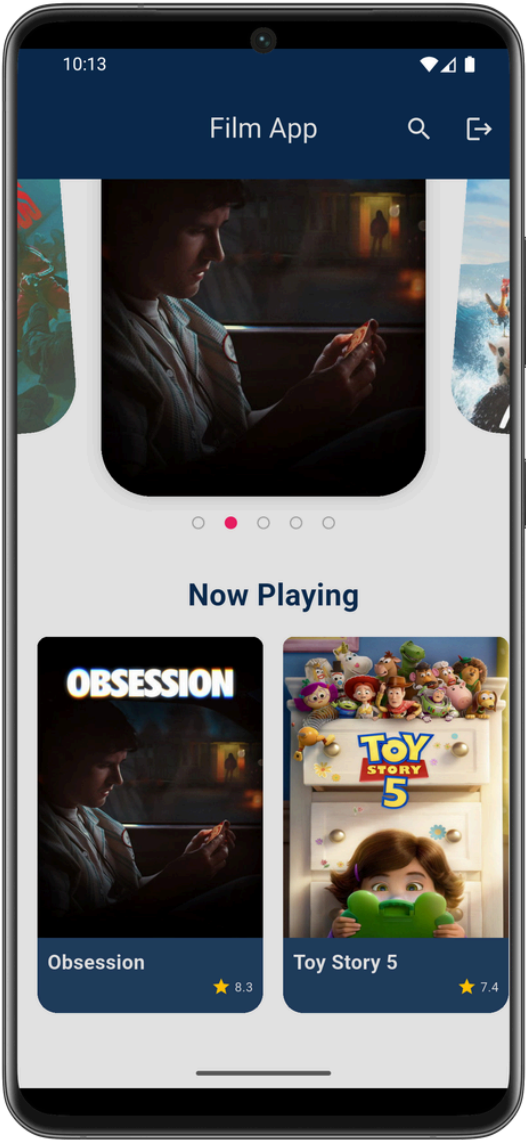

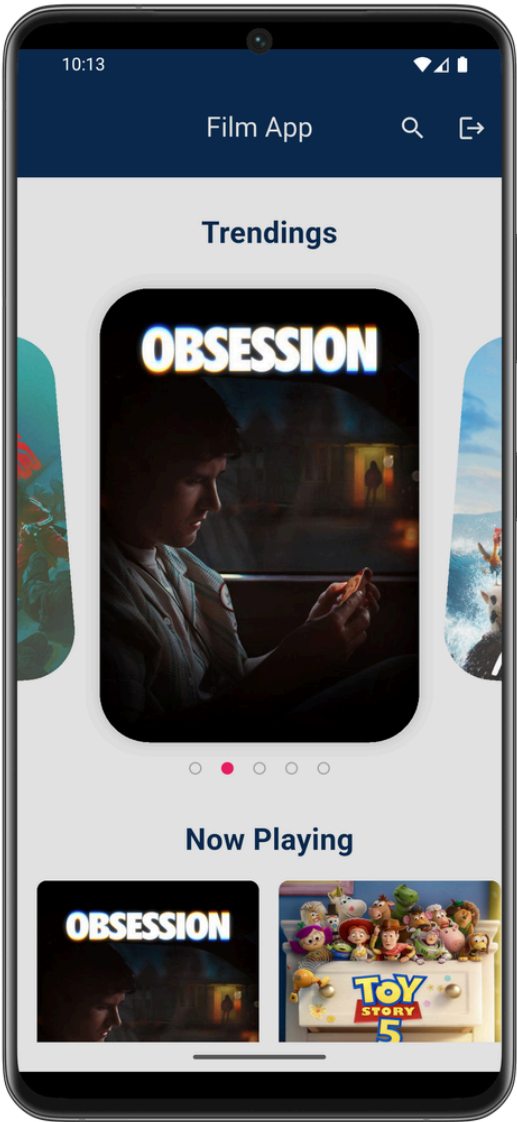

Authentication Feature

The authentication features in this application consist of Sign Up and Sign In.

The Sign Up feature is used to register a new account, while the Sign In feature is used to log into the application using an existing account.

The application's backend is developed using JavaScript, while user data is stored using a MongoDB database.

Main Menu

The app's main page consists of two sections:
Trending and Now Playing.

The Trending section displays currently popular movies using a
Fan Carousel Image Slider, while Now Playing displays a list of
movies using a horizontal ListView with separated card
components for better code structure.

The Movie Details page displays complete movie information
along with a trailer from YouTube based on the trailer key
obtained through the TMDB API.

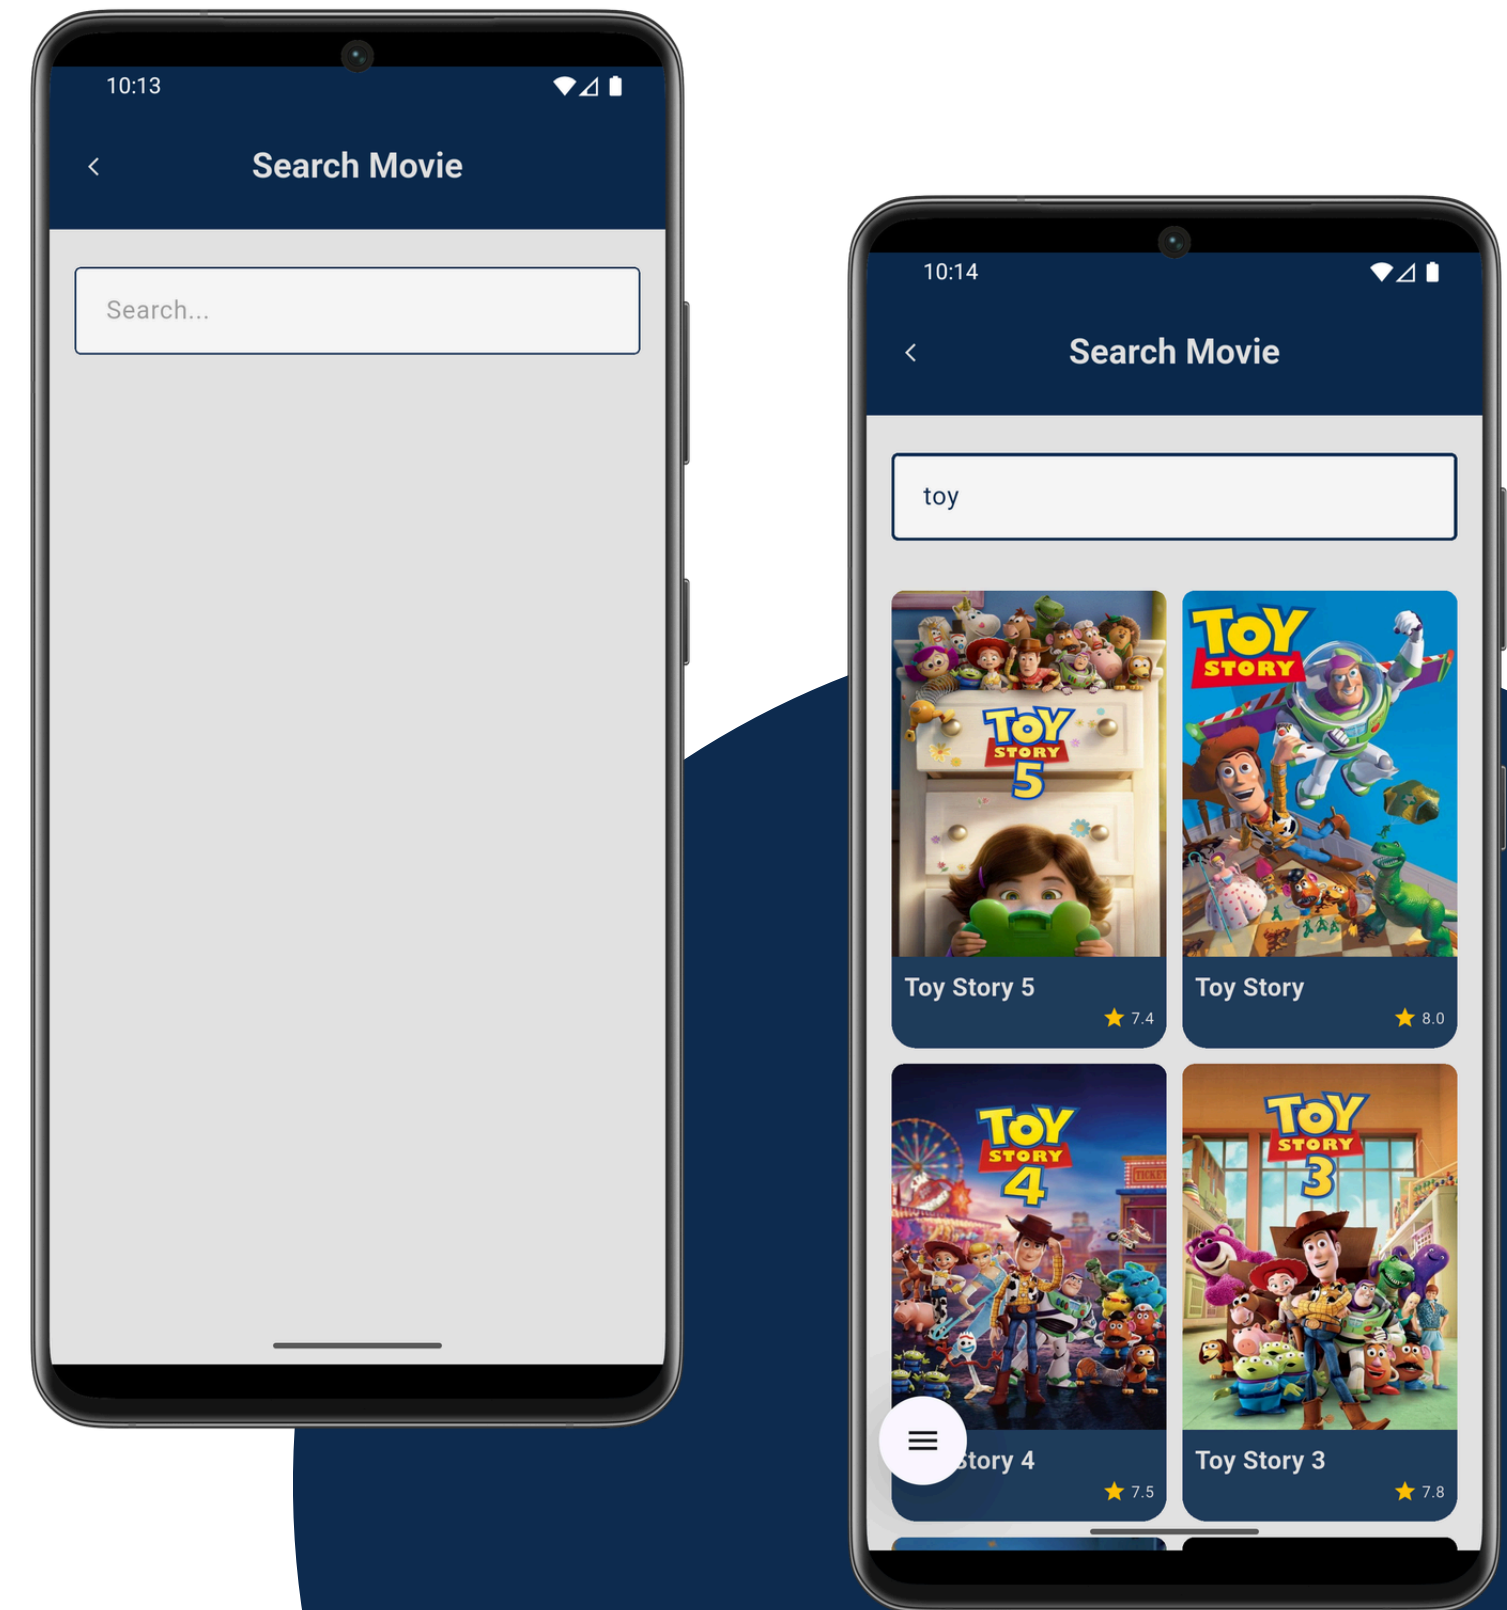

Search Page

The Search page provides a search field for searching for movies based on keywords.

The search process uses the onChanged trigger, so the data is updated every time the user changes the contents of the input field.

The search results are then displayed in a GridView using the movie card component.

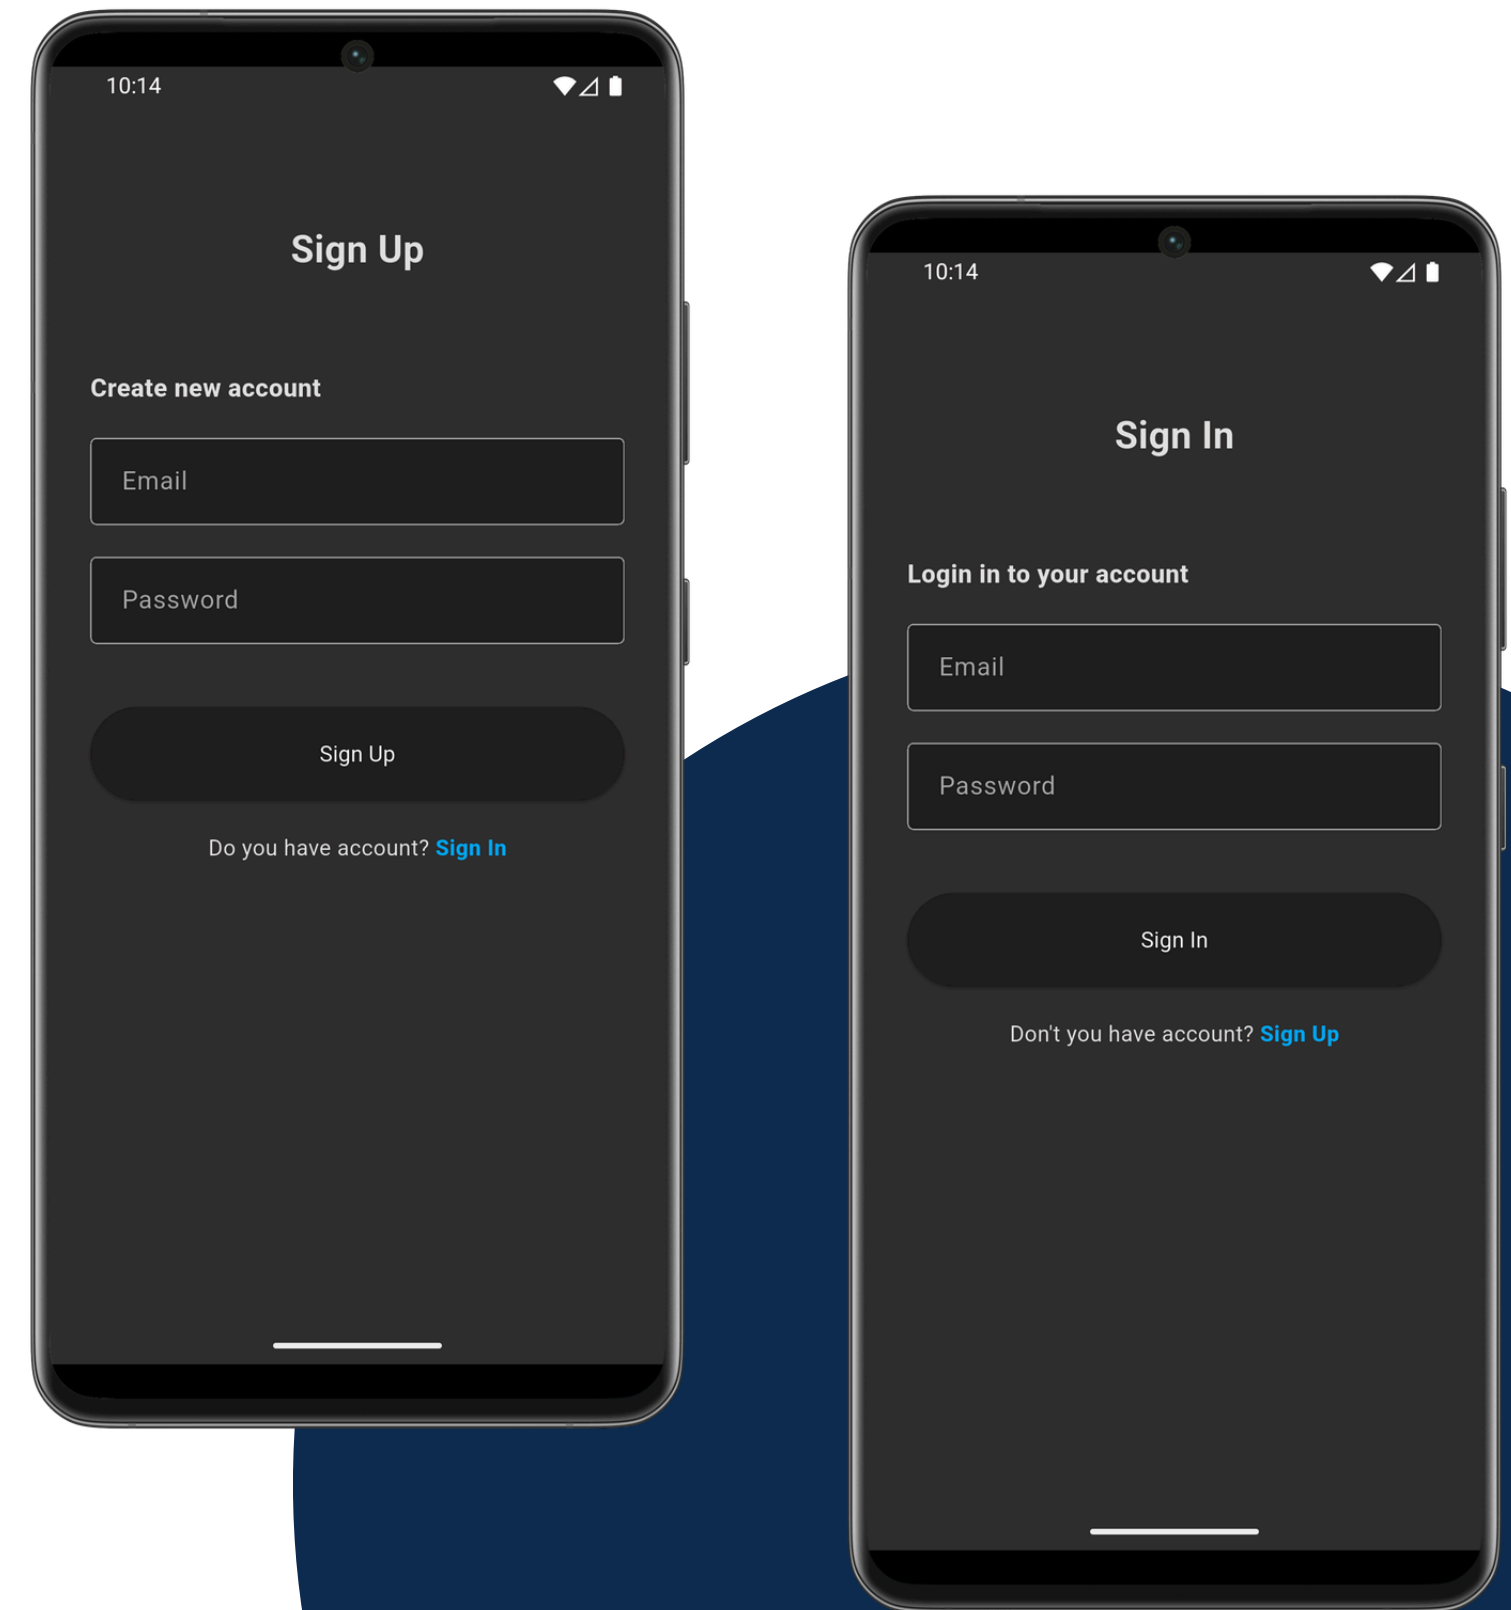

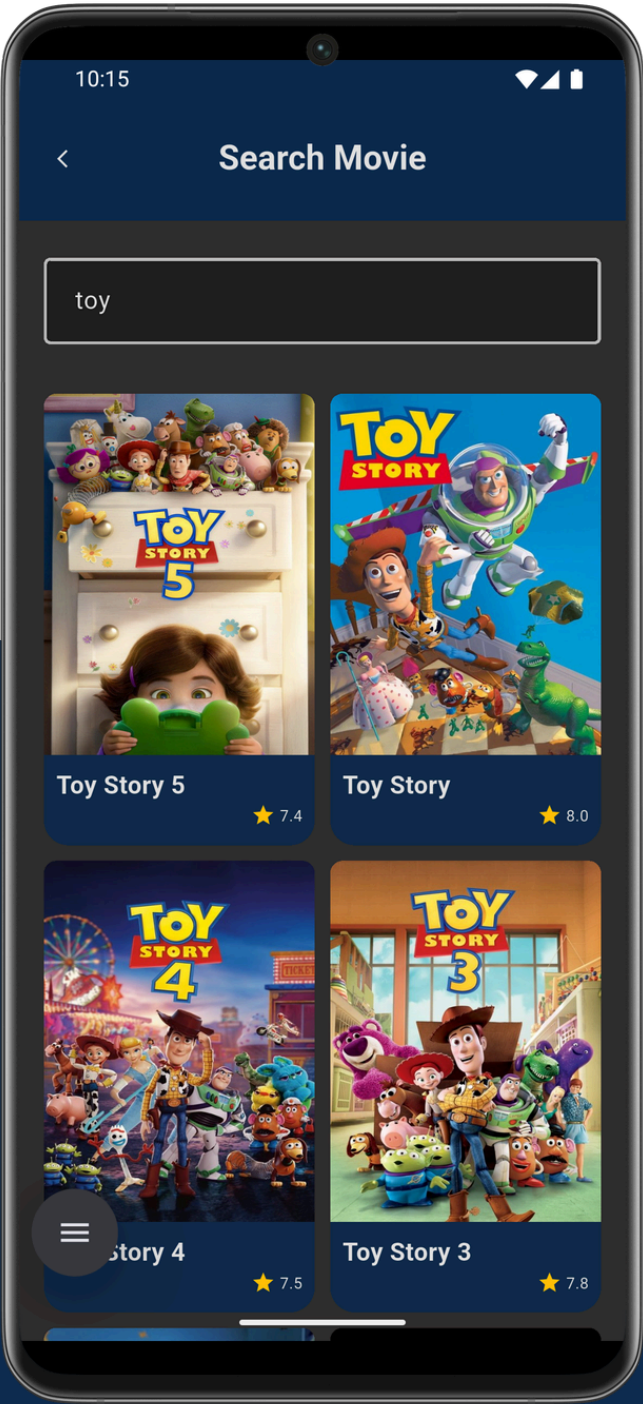

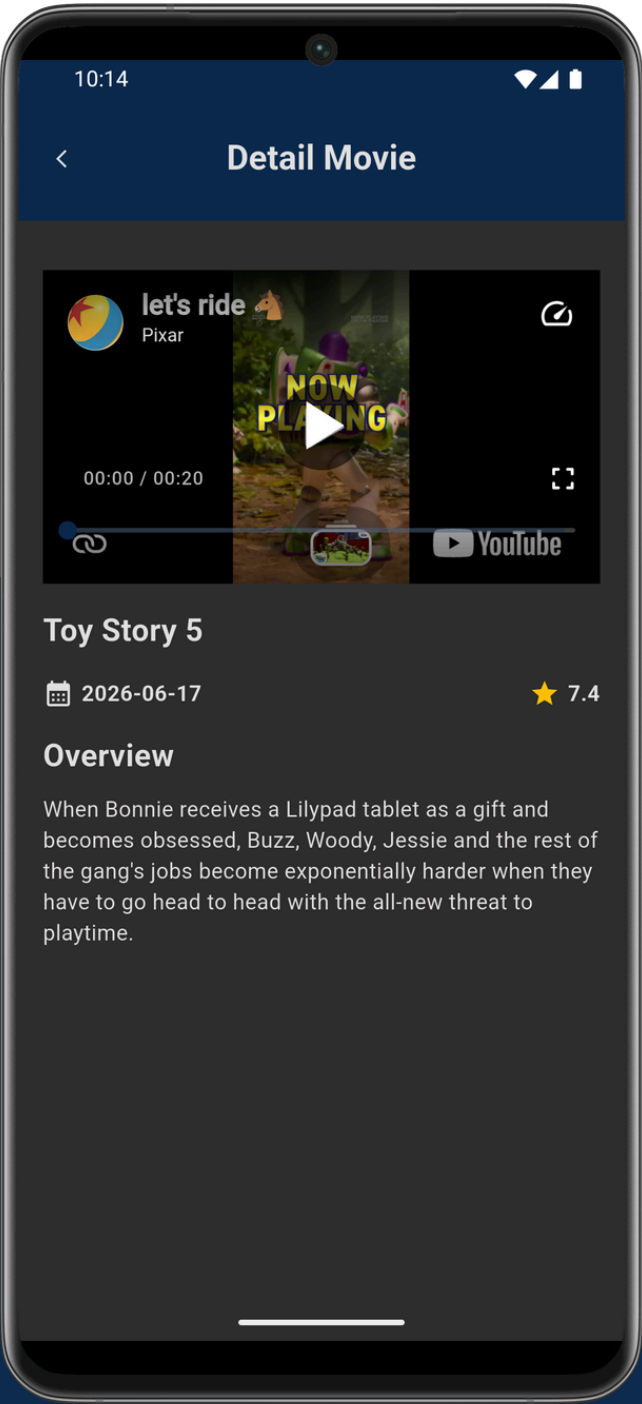

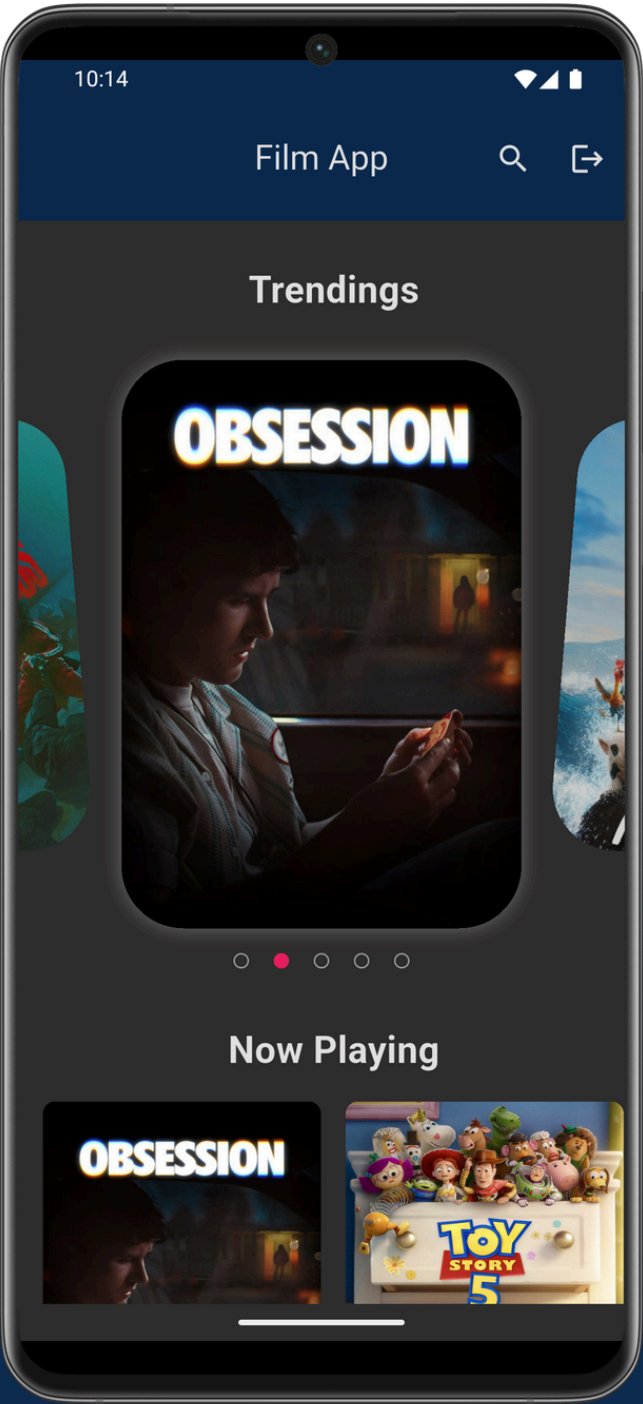

App Theme

This app supports both Dark and Light Mode.

The app's appearance will automatically adjust to the mode used on the user's device.

App Theme

Thank You

The Film Apps is a personal portfolio project.
