

# PWSP Apps

PWSP App is an application developed to manage the administrative operations of the PWSP organization. The main feature of this application is member data management.

In addition, the application includes various supporting features, such as PWSP Mart, which serves as a product display platform for businesses owned by members, and an Activity feature used to share information and news through the application. The app is also equipped with a member wallet feature to manage organizational funds collected from member contributions, along with other supporting functionalities.

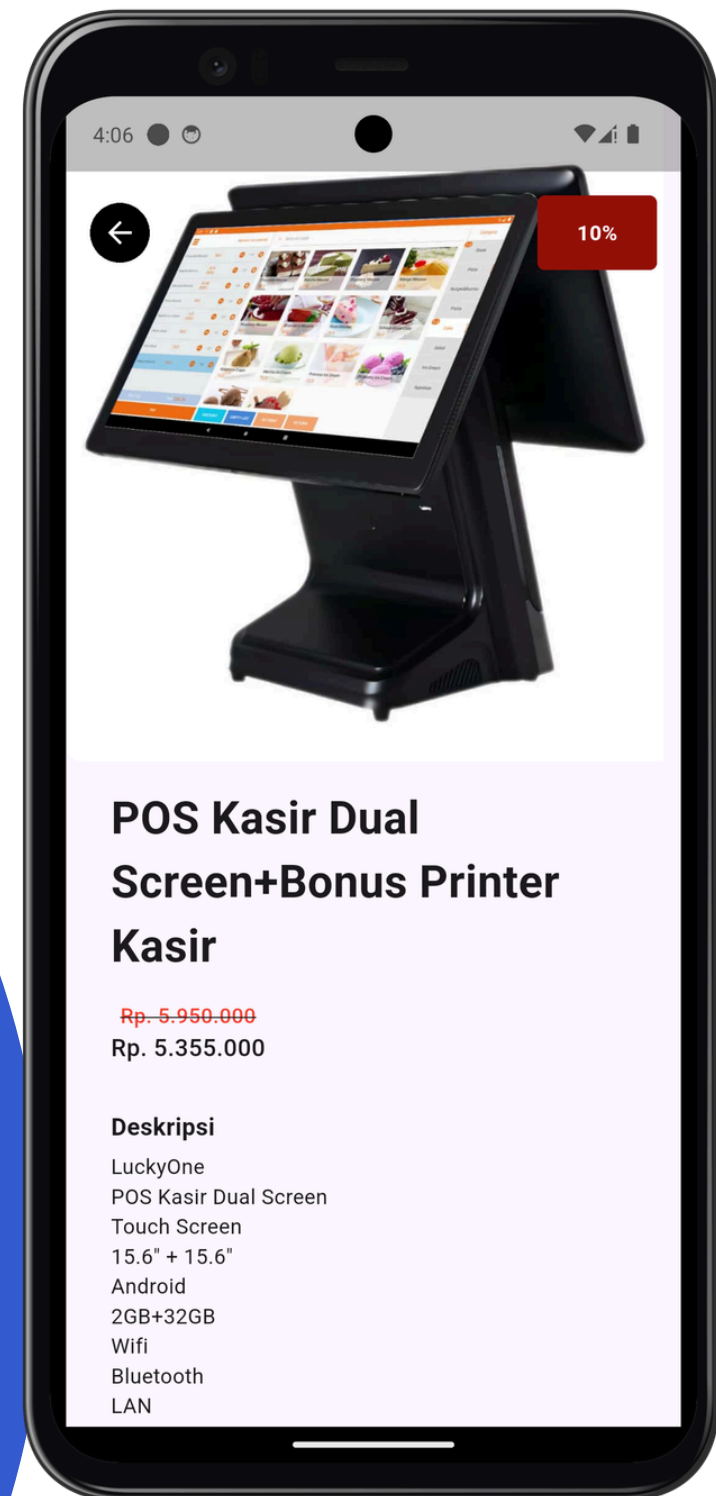

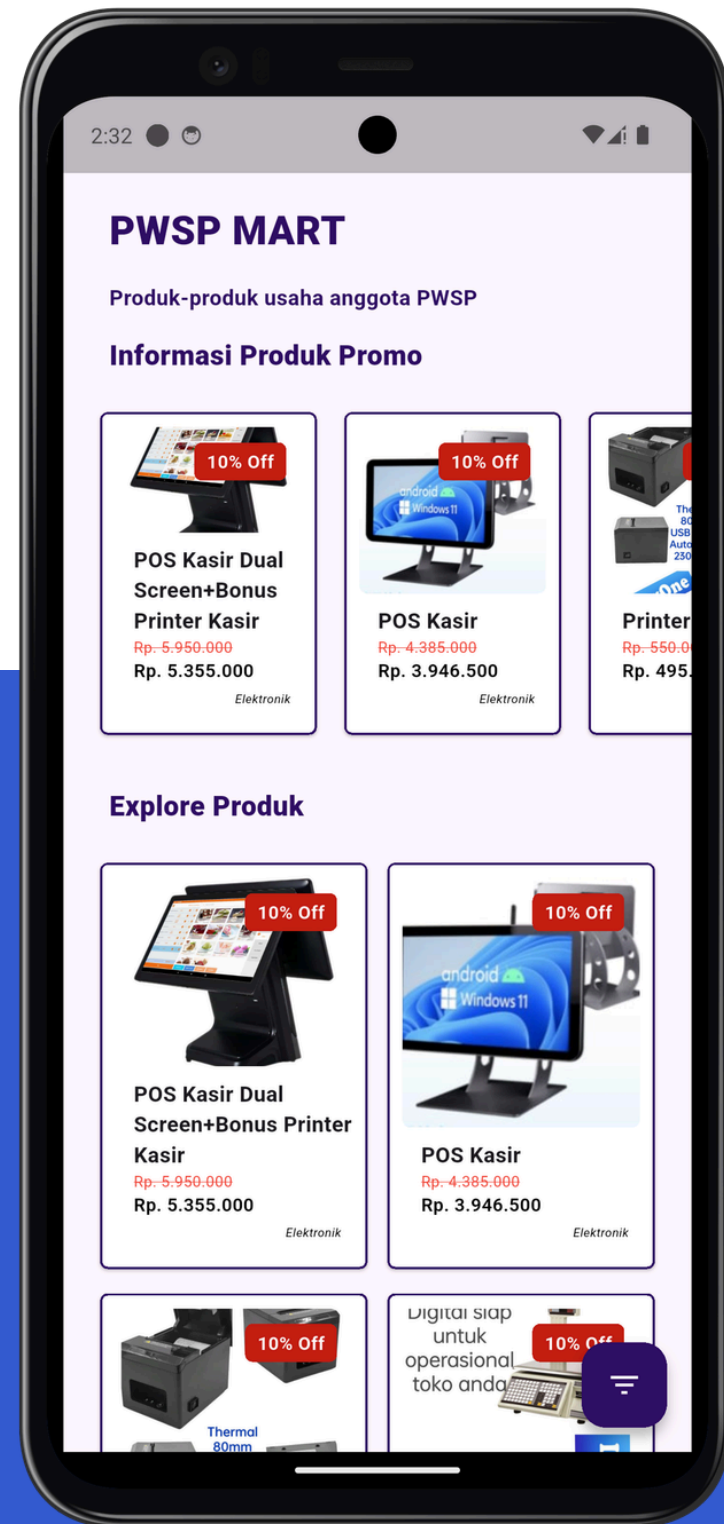

# Overview Application

The PWSP App was developed using the Flutter programming framework. The application data is managed using a MySQL database. All data is delivered to the application through APIs (Application Programming Interfaces) supported by a backend system built with PHP.

## Authentication Feature

The authentication feature consists of two main parts: Sign Up, which is used to register new member data, and Sign In, which allows users to access the application. In the Sign In feature, users can choose to log in using a phone number and password or an email address and password.

# Feature

## PWSP Mart

In addition to the authentication feature, the application includes the PWSP Mart feature, which is displayed on the home page. This feature allows users to access the mart page directly without logging in. The mart page displays product data from member-owned businesses, and users can view product details by selecting a specific product.

# User Access

The application includes a user role and access control feature. User access levels are determined through a verification process during login, where user data is checked against the database to identify the type of access assigned to each user.

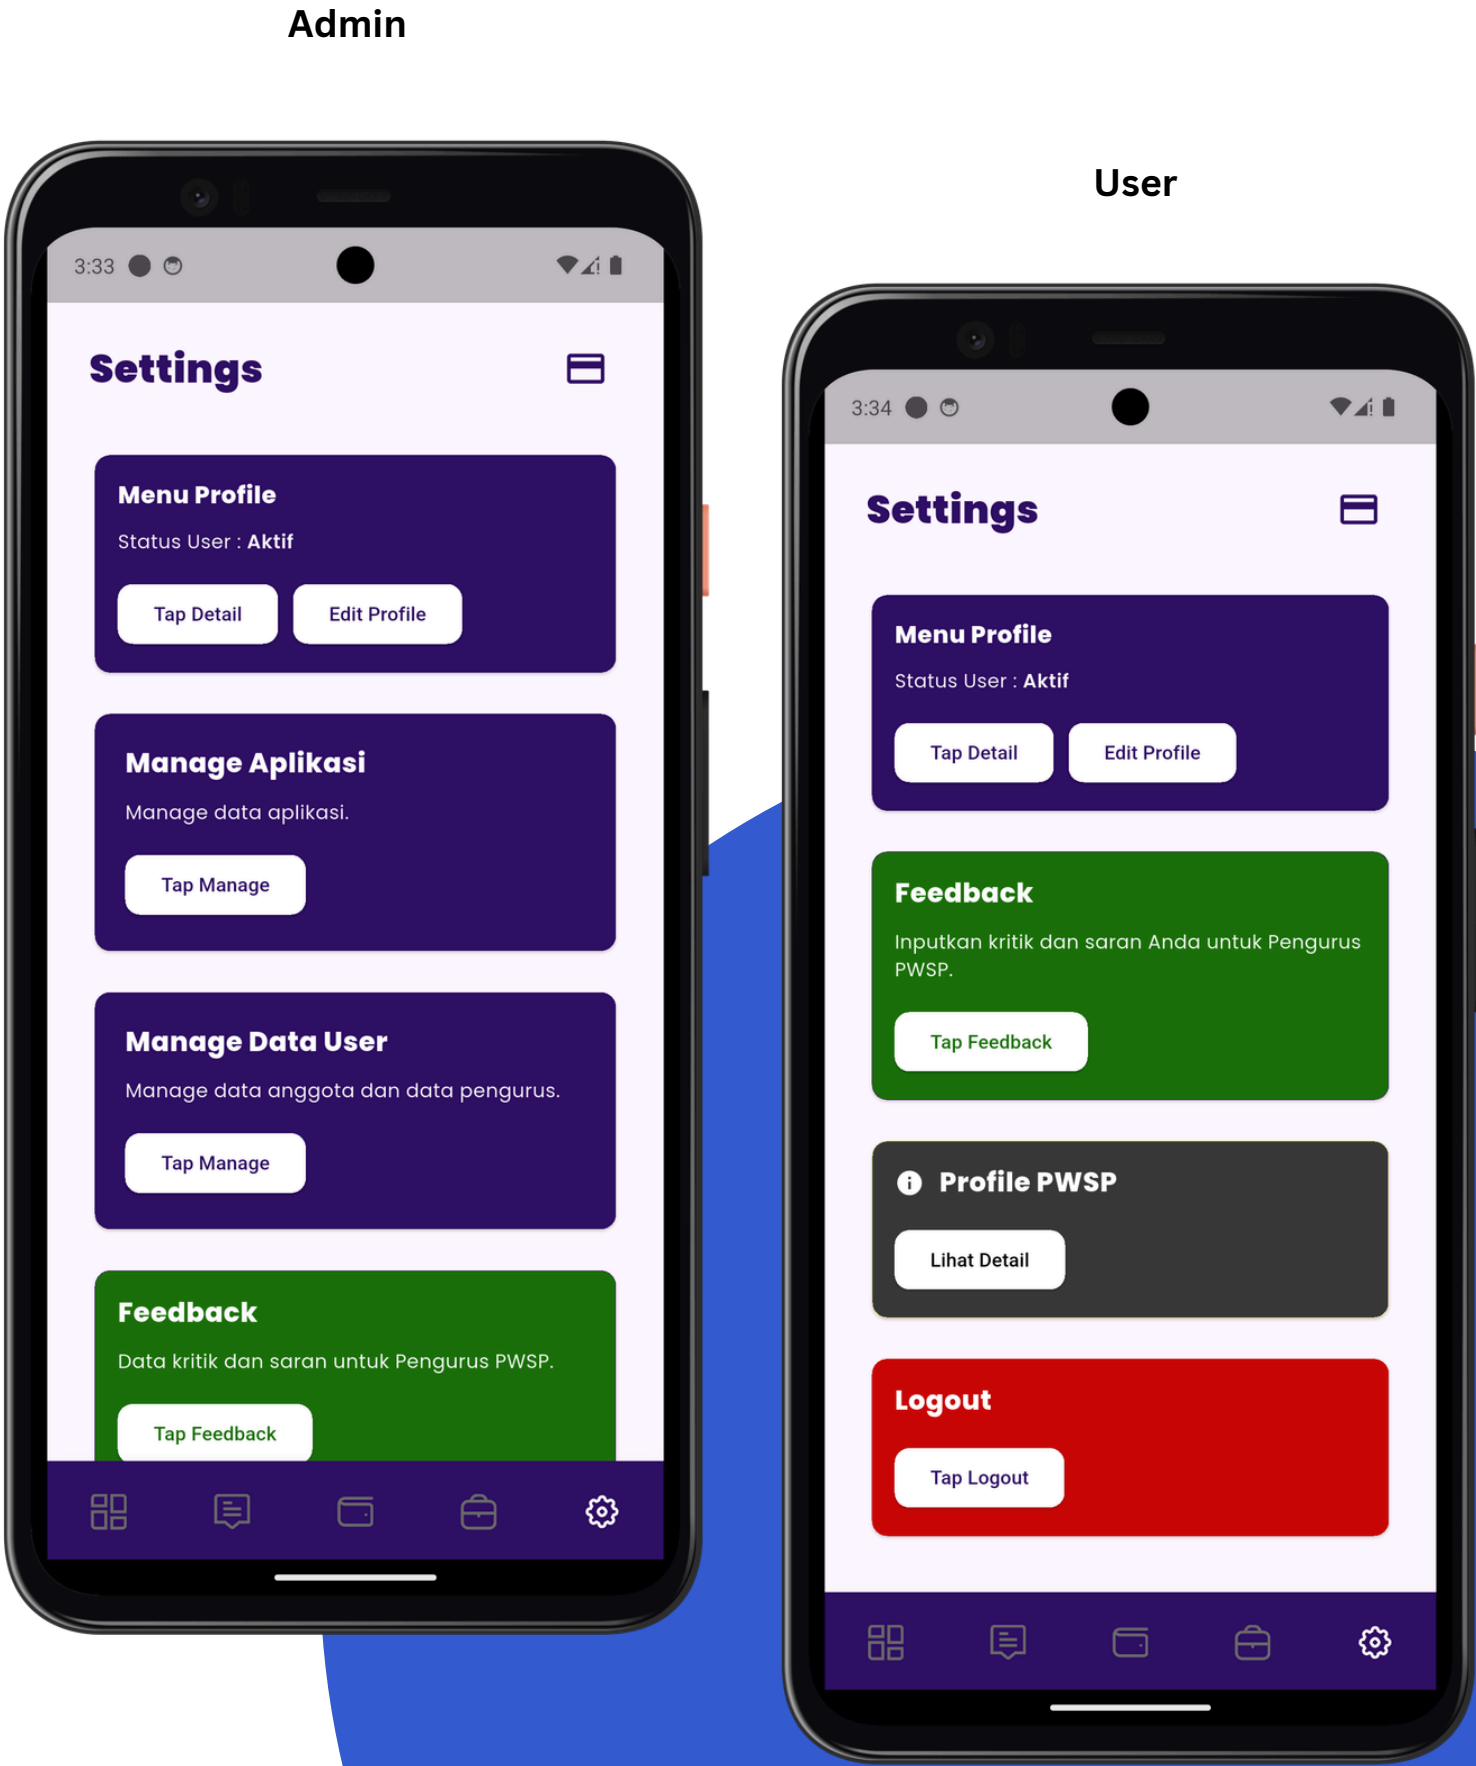

- 01

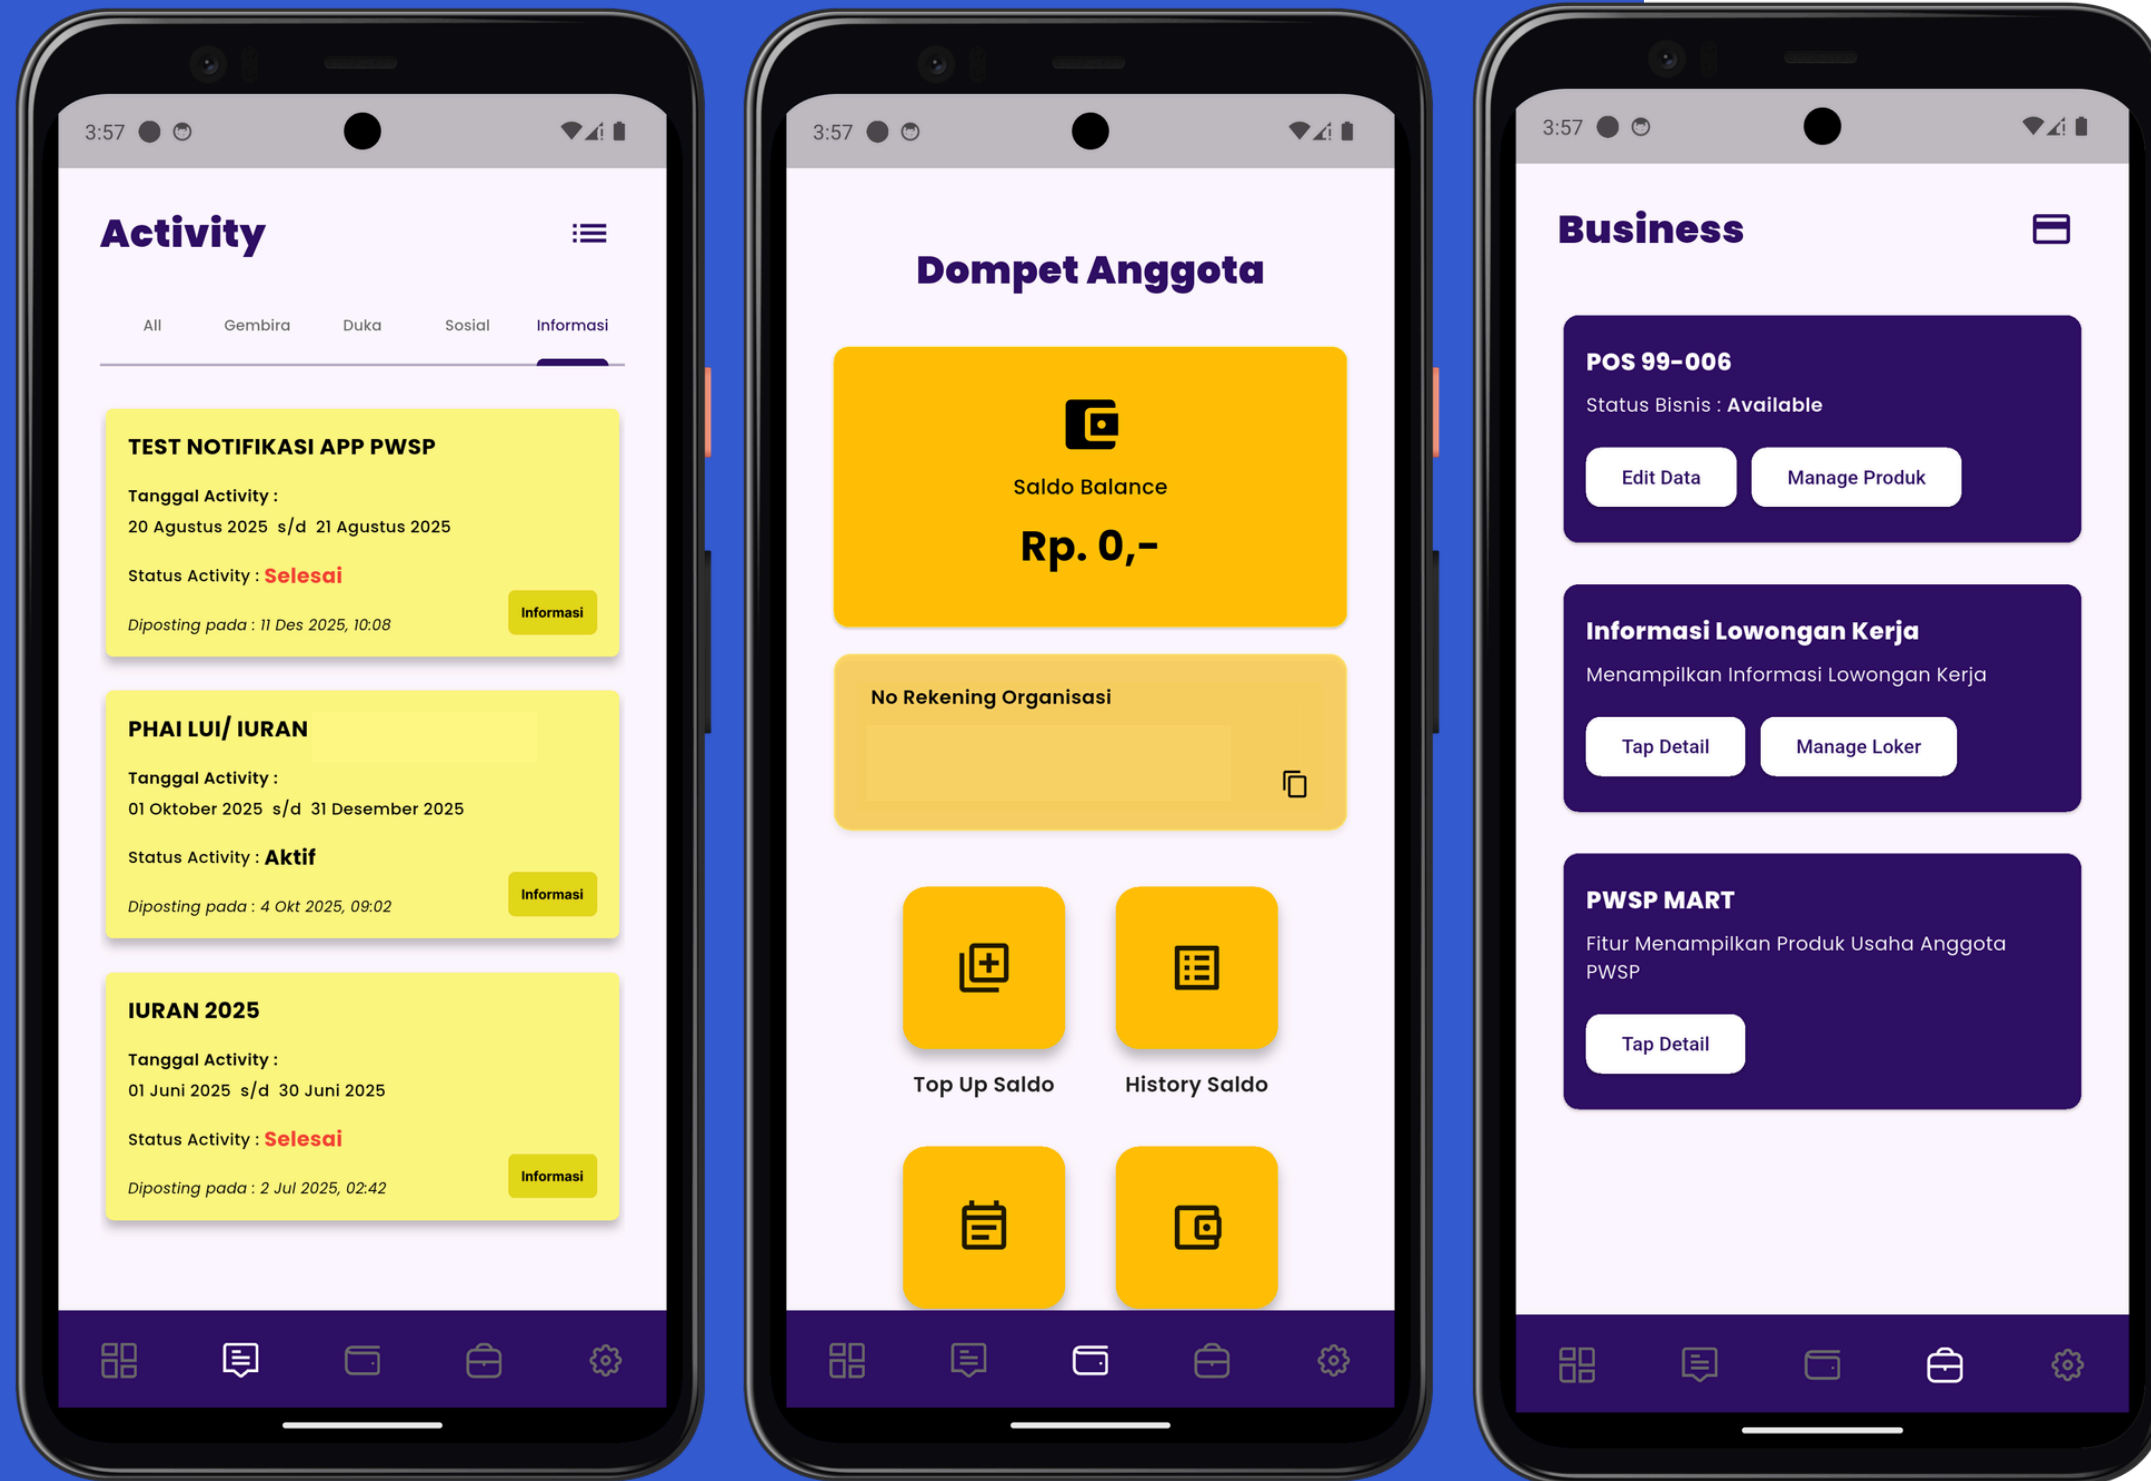

**Admin**

Admin access is a user access level assigned to administrators. This access level provides a wider range of features, as it is designed not only for viewing data but also for managing and maintaining application data within the system.
- 02

**User**

User access is assigned to general members. This access level provides fewer features compared to Admin access, as most of the available features are limited to viewing information only.

# Application Features

01

## Activity Feature

This feature allows the organization to share news, announcements, and updates with members through the application.

02

## Dompot Anggota Feature

This feature enables members to manage and track their contributions and payments within the application.

03

## Business Feature

This feature allows users to register their businesses and add products associated with their business.

# Notifications Feature

---

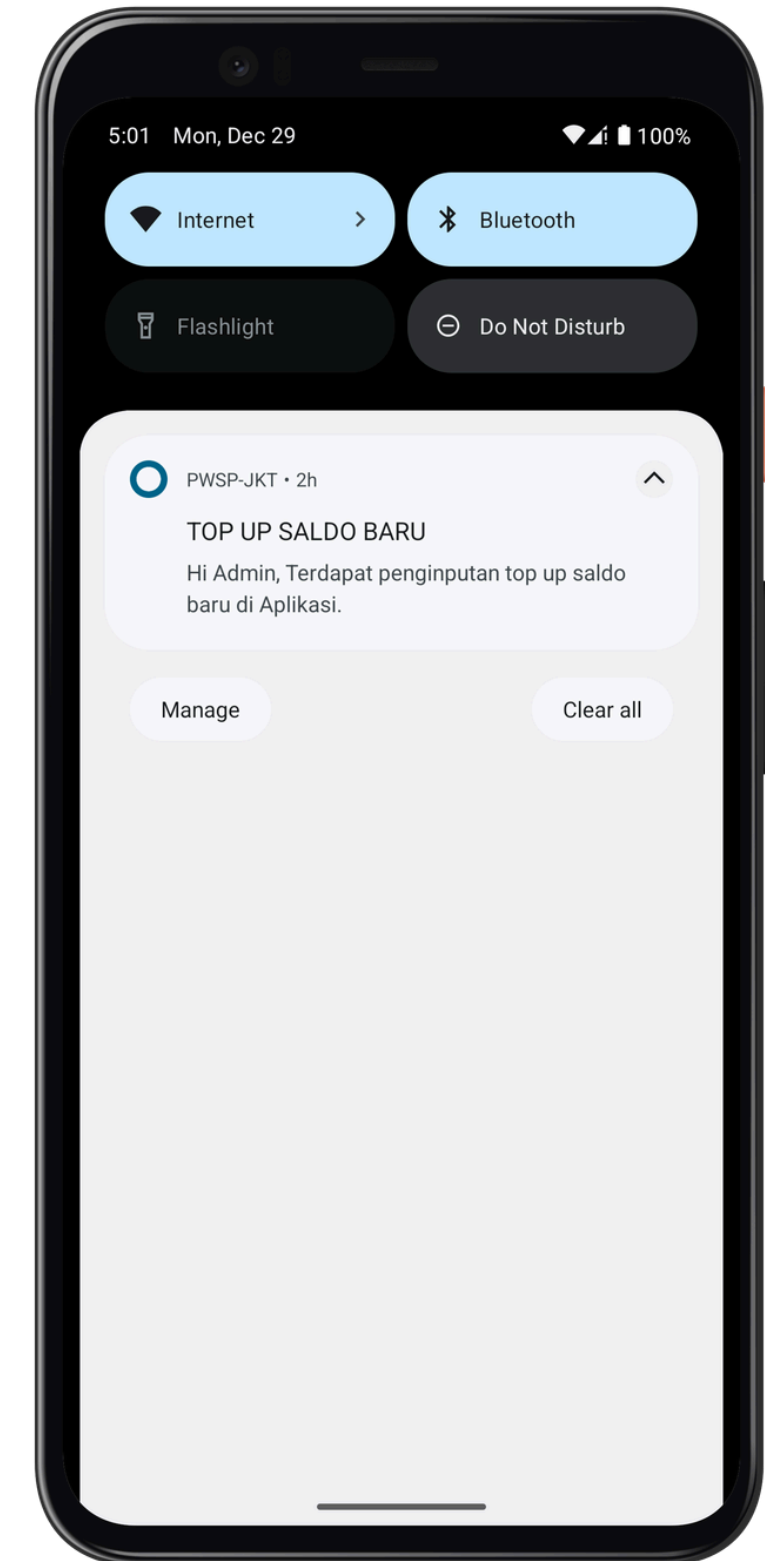

## Firebase Cloud Messaging

Sends API notifications to the application using Firebase Cloud Messaging whenever new data is input.

## Flutter Local Notifications

Receives notifications from Firebase via API and displays them in the application.

# Summary

---

## Flutter

The application was developed using the Flutter programming language.

## PHP

The backend was built using PHP.

## Firebase Cloud Messaging (FCM)

Notifications are handled using FCM. FCM sends API notifications to the application, which are then displayed using Flutter Local Notifications.

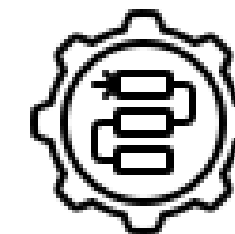

## MySQL

The application uses a MySQL database to manage data.

## API

Data is integrated from the backend to the application through APIs.

## Dependencies

In addition to Flutter, the application utilizes various supporting dependencies to enhance functionality.

# Thank You

---

The PWSP App has been published on the Google Play Store.  
You can view the application by clicking the following link.
